NEW GENERATION FIREWALL

- Firewall provide port on,off and implement routing process.
- Firewall blocks port attacks and it provides security of system.
- Rules can creating on group basis.
- Abroad countries ip is blocking as default. If create incorrec rule system spontaneously block it. (Cyber attacks originate largely from abroad these blocks have been closed by our systems. If require international connections,easily removable the blocks).

- Ports can be open and close with mobile application or manually. (Generally in firewall,admin opened port and forget it,that causes deficit in the system. For this reason, in Xlog, admin can open port based on time ,when time expired system off the port spontaneously. Also,admin or access users can open port basis of time on mobile application.)
- Firewall notifies any communication to port with SMS and mail. (If any requested to connect the ports. The system automatically notifies when e-mail address or phone number that define in the system.)
- Firewall supplies information about port connection and instantaneous IP connection.
